

# TELE-ULTRASOUND

The remote scanning and/or assessment of ultrasound images by a clinician that is distant from the patient. It can occur in two methods:

1

A robot arm is controlled remotely by a clinician to obtain images.

VS

2

Ultrasound images are taken by a person with the patient and reviewed by a remote clinician.

## Benefits of Tele-ultrasound

1

Accessible healthcare care despite physical barriers like geography or lack of transportation.

2

Potential for reduced person-to-person disease transmission (e.g. COVID-19)

3

Accessible training opportunities for new and experienced POCUS users.

4

Easy to include in established telehealth practices.

5

Increased accessibility to POCUS-trained healthcare professionals.
